

Start

Make a small start in the seam you wish to open with a normal air chisel. If there is already something to lever against you may not need to do this.

Use jaws

Start the jaws in the seam and open a small amount carefully

Small bites

Take small bites, close the tool and move it deeper into the seam.

Bigger

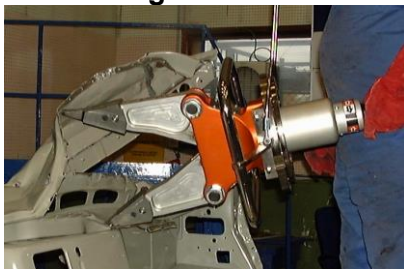

Once properly located you can start to pull the joint open.

Open the joint

Now you can take big pulls and the jaws will not slip or tear the metal.

Move along

Close the tool, move it along the joint and re-engage

Opened joint

The end result, less than 2 minutes from start to finish.
